Lamb Dispersion Curve MATLAB Code

The Lamb dispersion curve MATLAB code is an essential computational tool used by engineers and researchers working in the fields of ultrasonic testing, non-destructive evaluation, and material science. Lamb waves, also known as guided waves, are elastic waves that propagate in thin plates and are characterized by their dispersive nature, meaning their velocity varies with frequency and mode. Understanding these dispersion relations is critical for applications such as defect detection, material characterization, and structural health monitoring. MATLAB, with its powerful numerical computing capabilities, provides an ideal platform for implementing algorithms to compute and visualize Lamb wave dispersion curves efficiently. This article aims to provide an in-depth guide to developing, understanding, and utilizing MATLAB code for calculating Lamb dispersion curves, including the underlying theory, step-by-step implementation, and practical considerations.

Understanding Lamb Waves and Their Dispersion Curves

What Are Lamb Waves?

Lamb waves are elastic waves that propagate in elastic plates or thin structures, confined within the boundaries of the material. They are characterized by their multiple modes, which can be symmetric or antisymmetric, each with distinct displacement and stress distributions. Lamb waves are dispersive; their phase and group velocities depend on the frequency-thickness product (f·d). This dispersion makes their analysis more complex but also provides rich information about the material and structural properties.

Significance of Dispersion Curves

Dispersion curves graphically depict the relationship between frequency and phase velocity for different Lamb wave modes. They are vital because:

- They help identify which modes are excited at a given frequency.
- They assist in selecting optimal frequencies for inspection.
- They enable interpretation of signals received in non-destructive testing.
- They provide insights into material properties and structural integrity.

Mathematical Foundation of Lamb Dispersion Relations

The calculation of Lamb dispersion curves involves solving the Rayleigh?Lamb equations, which are derived from the equations of motion in elastic solids. These equations depend on the material's elastic constants, density, and the plate's thickness.

The key parameters include:

- Longitudinal wave speed $c_L = \sqrt{\frac{E(1-\nu)}{\rho(1+\nu)(1-2\nu)}}$
- Transverse wave speed $c_T = \sqrt{\frac{E}{2\rho(1+\nu)}}$
- Density ρ
- Young's modulus E
- Poisson's ratio ν
- Plate thickness d

The dispersion relations are transcendental equations involving Bessel functions, which are solved numerically.

Developing MATLAB Code for Lamb Dispersion Curves

Overview of the Implementation

Creating MATLAB code for Lamb dispersion curves generally involves the following steps:

- Define material properties and plate thickness.
- Set a frequency range or a range of ω (angular frequency).
- Calculate wave speeds and parameters.
- Formulate the Rayleigh?Lamb equations for symmetric and antisymmetric modes.
- Use numerical root-finding algorithms to solve the equations for each frequency.
- Store and plot the phase velocities versus frequency.

Essential MATLAB Functions and Techniques

To implement the code efficiently, familiarity with the following MATLAB features is recommended:

- Numerical solvers such as `fsolve`, `fzero`, or `fminsearch`.
- Bessel functions (`besselj`, `bessely`) for the mathematical expressions.
- Loop structures for iterating over frequency points.

- Plotting functions (`plot`, `semilogy`) for visualization.

Step-by-Step MATLAB Code for Lamb Dispersion Curves

- Define Material Properties and Parameters

```matlab
% Material properties (example: Aluminum)
E = 69e9; % Young's modulus in Pascals
nu = 0.33; % Poisson's ratio
rho = 2700; % Density in kg/m^3
d = 1e-3; % Plate thickness in meters
% Derived wave speeds
cL = sqrt(E(1 - nu) / (rho(1 + nu)(1 - 2nu))); % Longitudinal wave speed
cT = sqrt(E / (2rho(1 + nu))); % Transverse wave speed
```

- Define Frequency Range

```matlab
% Frequency range in Hz
f_min = 1e4; % 10 kHz
f_max = 1e7; % 10 MHz
num_points = 500; % Number of frequency points
freq = linspace(f_min, f_max, num_points);
```

omega = 2 pi freq; % Angular frequency

```

- Set Up Dispersion Equations

Define functions representing the symmetric and antisymmetric Rayleigh?Lamb equations.

```matlab

% Function for symmetric modes

function val = lamb_symmetric(q, omega, cL, cT, d)

k = omega / cL; % Wavenumber

alpha = sqrt(q.^2 - (omega / cT)^2);

beta = sqrt(q.^2 - (omega / cL)^2);

% To avoid complex square roots, use real parts or magnitude

J0_alpha_d = besselj(0, alphad);

J1_alpha_d = besselj(1, alphad);

J0_beta_d = besselj(0, betad);

J1_beta_d = besselj(1, betad);

% Left side of the symmetric equation

val = ( ( (2 - (q^2)(d^2)) J1_alpha_d ) / (alpha J0_alpha_d) ) - ...

( (2 - (q^2)(d^2)) J1_beta_d ) / (beta J0_beta_d);

end

% Function for antisymmetric modes

```
function val = lamb_antisymmetric(q, omega, cL, cT, d)

k = omega / cL;

alpha = sqrt(q.^2 - (omega / cT)^2);

beta = sqrt(q.^2 - (omega / cL)^2);

J0_alpha_d = besselj(0, alphad);

J1_alpha_d = besselj(1, alphad);

J0_beta_d = besselj(0, betad);

J1_beta_d = besselj(1, betad);

% Right side of the antisymmetric equation

val = (((q^2)(d^2) - 2) J1_alpha_d) / (alpha J0_alpha_d) + ...

(((q^2)(d^2) - 2) J1_beta_d) / (beta J0_beta_d);

end
```

Note: The above functions are illustrative; actual formulations involve more precise expressions involving Bessel functions and their derivatives, and may include complex numbers.

- Numerical Solution for Each Frequency

Using `fsolve` or `fzero`, find the q (wavenumber) that satisfies the dispersion relation at each frequency.

```matlab
% Initialize arrays to store phase velocities

c_p_symmetric = zeros(1, num_points);
```

```
c_p_antisymmetric = zeros(1, num_points);

% Set options for the solver

options = optimset('Display', 'off');

for i = 1:num_points

omega_i = omega(i);

% Define initial guesses for q

q_guess_symmetric = omega_i / cT; % initial guess

q_guess_antisymmetric = omega_i / cT; % initial guess

% Solve for symmetric mode

q_sym = fsolve(@(q) lamb_symmetric(q, omega_i, cL, cT, d), q_guess_symmetric, options);

% Compute phase velocity

c_p_symmetric(i) = omega_i / q_sym;

% Solve for antisymmetric mode

q_antisym = fsolve(@(q) lamb_antisymmetric(q, omega_i, cL, cT, d), q_guess_antisymmetric,
options);

c_p_antisymmetric(i) = omega_i / q_antisym;

end
```

Note: Proper initial guesses are crucial for convergence. Also, handling complex solutions or multiple roots may require additional logic.

Visualizing the Lamb Dispersion Curves

Plotting the Results

```matlab

xlabel('Frequency (MHz)');

ylabel('Phase Velocity (km/s)');

title('Lamb Wave Dispersion Curves');

They describe how different wave modes travel at various frequencies and wavelengths, revealing critical insights into material properties, structural health, and nondestructive testing applications. Generating accurate lamb dispersion curves MATLAB code allows engineers and researchers to simulate and interpret elastic wave behavior efficiently, facilitating both theoretical analysis and practical diagnostics.

In this comprehensive guide, we will explore the underlying principles of Lamb waves, the mathematical formulation for dispersion curves, and step-by-step instructions for developing MATLAB code to compute these curves. Whether you're a seasoned researcher or a student new to wave mechanics, this article aims to provide a thorough understanding and practical implementation strategy.

What Are Lamb Waves and Dispersion Curves?

Lamb Waves: An Overview

Lamb waves are a type of guided elastic wave that propagates in thin plates and shells. They are characterized by their symmetric and antisymmetric modes, each with unique displacement profiles across the thickness of the material. These waves are dispersive, meaning their phase and group velocities depend on frequency and wavelength.

Dispersion Curves: Significance and Utility

Lamb dispersion curves graphically represent the relationship between frequency (f) and wavenumber (k) or phase velocity (v), illustrating how different modes behave across a spectrum. These curves are essential for:

- Mode identification: Determining which wave modes are excited at specific frequencies.
- Material characterization: Inferring material properties like Young's modulus and Poisson's ratio.
- Structural health monitoring: Detecting flaws, cracks, or delaminations by analyzing wave mode alterations.

Mathematical Foundations of Lamb Dispersion Curves

Governing Equations

The derivation begins with the equations of motion for elastic waves in an isotropic, homogeneous plate:

$$
\nabla^2 \mathbf{u} + \frac{\omega^2}{c^2} \mathbf{u} = 0
$$

where:

- $\mathbf{u}$ is the displacement vector,
- ω is the angular frequency,
- c is the wave speed.

Applying boundary conditions at the free surfaces yields the characteristic equations for symmetric (S) and antisymmetric (A) modes.

Characteristic Equations

The dispersion relations involve transcendental equations:

- Symmetric modes:

$$
\tan(qh) = -\frac{4k^2 q p}{(q^2 - k^2)^2}
$$

- Antisymmetric modes:

$$
\tan(ph) = -\frac{4k^2 q p}{(q^2 - k^2)^2}
$$

\]

where:

- \(k\) is the wavenumber,
- \(h\) is the plate thickness,
- \(p\) and \(q\) are functions of \(k\), \(\omega\), and material properties.

These equations are typically solved numerically to obtain dispersion curves.

Step-by-Step Guide to Developing Lamb Dispersion Curve MATLAB Code

- Define Material and Geometrical Properties

Start by specifying the physical parameters:

```matlab

% Material properties

E = 210e9; % Young's modulus in Pascals

nu = 0.3; % Poisson's ratio

rho = 7800; % Density in kg/m^3

% Plate thickness

h = 0.01; % Thickness in meters

```

- Calculate Elastic Constants

Compute longitudinal and transverse wave velocities:

```matlab
```

% Longitudinal wave velocity

cl = sqrt(E(1 - nu)/((1 + nu)(1 - 2nu))/rho);

% Transverse wave velocity

ct = sqrt(E/(2(1 + nu))/rho);

```

- Establish Frequency and Wavenumber Ranges

Set the frequency range over which to calculate the dispersion curves:

```matlab

freq = linspace(0, 500e3, 1000); % Frequency from 0 to 500 kHz

omega = 2pifreq; % Convert to angular frequency

```

Define a range of wavenumbers or wavelengths:

```matlab

k = linspace(0, 10e3, 1000); % Wavenumber range

```

- Implement the Characteristic Equations

Create functions for symmetric and antisymmetric modes:

```matlab

function D_symmetric = lamb_symmetric_eq(k, omega, h, cl, ct)

% Calculate parameters

```
p = sqrt((omega.^2)/(cl^2) - k.^2);

q = sqrt((omega.^2)/(ct^2) - k.^2);

% Handle complex square roots

p = real(p) + 1iabs(imag(p));

q = real(q) + 1iabs(imag(q));

% Characteristic equation for symmetric modes

D_symmetric = tan(qh) - (4k.^2 . p . q) ./ ((q.^2 - k.^2).^2);

end

function D_antisymmetric = lamb_antisymmetric_eq(k, omega, h, cl, ct)

% Calculate parameters

p = sqrt((omega.^2)/(cl^2) - k.^2);

q = sqrt((omega.^2)/(ct^2) - k.^2);

% Handle complex square roots

p = real(p) + 1iabs(imag(p));

q = real(q) + 1iabs(imag(q));

% Characteristic equation for antisymmetric modes

D_antisymmetric = tan(ph) + (4k.^2 . p . q) ./ ((q.^2 - k.^2).^2);

end
```

- Numerical Solution for Dispersion Curves

Use root-finding algorithms, such as `fzero` or `fsolve`, to find zeros of the characteristic equations:

```matlab
% Initialize arrays to store phase velocities
v_symmetric = zeros(length(freq),1);
v_antisymmetric = zeros(length(freq),1);
for idx = 1:length(freq)
w = omega(idx);
% For each frequency, scan over k to find roots
k_vals = linspace(0, 10e3, 1000);
D_sym = lamb_symmetric_eq(k_vals, w, h, cl, ct);
D_anti = lamb_antisymmetric_eq(k_vals, w, h, cl, ct);
% Find zeros indicating mode solutions
% Simple approach: look for sign changes
sym_roots = find_sign_changes(D_sym);
anti_roots = find_sign_changes(D_anti);
% For each root, compute phase velocity v = w / k
for r = 1:length(sym_roots)
k_root = k_vals(sym_roots(r));
v_symmetric(idx) = w / k_root;
end
for r = 1:length(anti_roots)
```

```
k_root = k_vals(anti_roots(r));

v_antisymmetric(idx) = w / k_root;

end

end
```

Note: Implement the `find_sign_changes` function to detect where the characteristic function changes sign, indicating a root.

- Plotting the Dispersion Curves

Finally, visualize the results:

```matlab
figure;

plot(freq/1e3, v_symmetric, 'b', 'LineWidth', 2);

hold on;

plot(freq/1e3, v_antisymmetric, 'r', 'LineWidth', 2);

xlabel('Frequency (kHz)');

ylabel('Phase Velocity (m/s)');

title('Lamb Dispersion Curves');

legend('Symmetric Modes', 'Antisymmetric Modes');

grid on;
```
